

End-to-End Static Website Deployment

Personal Portfolio — Multi-Cloud Deployment using Azure & GitHub Pages

Author	Saiteja Kondameedi	Role	Multi-Cloud DevSecOps Engineer
Date	June 2026	Environment	WSL (Ubuntu) on Windows 11
GitHub Repo	github.com/SAITEJA-KONDAMEEDI/saiteja-portfolio		

1. Executive Summary

This report documents the end-to-end design, development, and deployment of a personal portfolio website by Saiteja Kondameedi, a Multi-Cloud DevSecOps Engineer. The project demonstrates hands-on proficiency in web development, cloud infrastructure (Microsoft Azure), and DevOps tooling (Git, GitHub Actions, GitHub Pages).

The portfolio was successfully deployed to two independent live platforms — Azure Blob Storage static hosting and GitHub Pages — validating the complete DevOps lifecycle from local development to public cloud delivery.

2. Project Overview

2.1 Objective

To build and publicly host a professional portfolio website that presents skills, projects, certifications, and contact information — deployed simultaneously on Microsoft Azure and GitHub Pages as a demonstration of multi-cloud competency.

2.2 Technology Stack

Category	Technology / Tool
Frontend	HTML5, CSS3, JavaScript (single file: index.html)
Development Environment	Visual Studio Code on WSL (Ubuntu) — Windows 11
Version Control	Git + GitHub (HTTPS authentication via GitHub CLI)
Cloud Hosting — Primary	Microsoft Azure Blob Storage (Static Website)
Cloud Hosting — Secondary	GitHub Pages
Resume Hosting	Azure Blob Storage (\$web container)

2.3 Deliverables

- A fully functional, publicly accessible portfolio website
- Resume hosted and downloadable as a PDF (111.58 KiB)

- Source code version-controlled on GitHub
- Two live deployment URLs — Azure and GitHub Pages

3. Work Completed — Step by Step

Step 1: Project Setup in WSL

The initial project was created in a folder called saiteja-portfolio under WSL Ubuntu. This older structure contained multiple CSS folders (CSS/ and css/), multiple HTML files (index1.html, index4.html), images, js, and assets directories — a total of 9 items. Minor issues identified included a duplicate CSS folder and a filename typo (sytle.css), which were documented.

The project was later refactored and cleaned into a streamlined folder called sai-portfolio (located at Linux > Ubuntu > saiteja > static > sai-portfolio) containing just 3 items: .git, assets, and a single index.html file. This cleaner structure was used for all subsequent development and deployment.

Screenshot: Original saiteja-portfolio folder structure (9 items):

Windows Explorer — saiteja-portfolio (original folder, 9 items)

Screenshot: Final cleaned sai-portfolio folder structure (3 items):

Windows Explorer — sai-portfolio (final folder: .git, assets, index.html)

Step 2: Website Development in VS Code

The portfolio was developed using Visual Studio Code with the project open as sai-portfolio. The main file is a single index.html containing all HTML structure, embedded CSS (using CSS custom properties / variables for theming), and JavaScript. The site uses Google Fonts (Space Grotesk and Inter) and a dark navy color scheme (#0A0F1E). Local browser preview was accessed via the WSL file path: `wsl.localhost/Ubuntu/saiteja/static/sai-portfolio/index.html`.

The site features a hero section with profile photo, name, role (DevOps Engineer · Azure · Cloud Infrastructure), bio, and navigation links to Skills, Projects, Certs, Education, and Contact sections.

Step 3: Azure Static Website Deployment

A StorageV2 (General Purpose v2) storage account named saitejastaticweb2026 was created in the Central India region under the SAITEJA DEVOPS ENGINEER subscription. Static website hosting was enabled, auto-creating the \$web container. The portfolio HTML file (index.html, 1.34 MiB) and resume

PDF (saitejakondameedi_resume, 111.58 KiB) were uploaded to the \$web container. The site was verified live at the Azure primary endpoint.

Azure Portal — \$web container showing indexx.html and resume PDF uploaded

Step 4: Push to GitHub & Deploy via GitHub Pages

The sai-portfolio repository was initialized, committed, and pushed to GitHub using Git CLI and GitHub CLI (gh) authentication. Initial push conflicts due to pre-existing remote commits were resolved with a force push. GitHub Pages was configured to deploy from the main branch root, bringing the site live. The final portfolio is publicly accessible at the GitHub Pages URL.

Two screenshots of a GitHub profile and repository settings.

The top screenshot shows the GitHub profile of SAITEJA KONDAMEEDI. The profile includes a bio: "Aspiring Multi-Cloud DevSecOps Engineer | Azure • AWS • GCP | Linux • Docker • Kubernetes • Terraform • GitHub Actions | Passionate about Cloud Infrastructure," and a location of "Hyderabad, India". The repository list shows "saiteja-portfolio" (HTML, updated 7 hours ago), "saiteja-portfolio-" (HTML, updated 8 hours ago), "BakeryTemplate" (JavaScript, updated 3 weeks ago), "appservice" (updated 3 weeks ago), and "github.com" (updated 3 weeks ago).

The bottom screenshot shows the "Settings" page for the "saiteja-portfolio" repository. The "GitHub Pages" section indicates the site is live at <https://saiteja-kondameedi.github.io/saiteja-portfolio/>. The "Build and deployment" section shows the source is set to "main" and the root directory is "/ (root)". The "Custom domain" section provides information on how to add a custom domain.

4. Live Deployments

Platform	Live URL	Status
Azure Static Website	saitejastaticweb2026.z29.web.core.windows.net	Live
GitHub Pages	saiteja-kondameedi.github.io/saiteja-portfolio-/	Live

Both deployments were verified — portfolio renders correctly and the resume PDF downloads successfully from the Azure endpoint.

5. Issues Encountered & Resolutions

Issue	Root Cause	Resolution
Duplicate CSS folders (CSS/ and css/)	Case-sensitivity difference in WSL vs Windows	Resolved by refactoring into clean sai-portfolio folder with single index.html
Filename typo: sytle.css	Manual naming error during initial setup	Resolved in final version — CSS embedded directly in index.html
Git push rejected (fetch first)	Remote had conflicting commits from initialization	Used git push --force to override
remote origin already exists	Remote was added twice during setup	Verified with git remote -v before re-adding

assets/ folder untracked	Forgot to stage the assets directory	Explicitly staged with git add assets/
--------------------------	--------------------------------------	--

6. Key Outcomes & Demonstrated Skills

- **Cloud Infrastructure:** Provisioned and configured Azure Blob Storage with static website hosting in Central India region
- **DevOps Workflow:** End-to-end Git workflow: init, commit, remote setup, force push, and branch management
- **Multi-Cloud Delivery:** Simultaneous deployment to Azure and GitHub Pages from a single source repository
- **Web Development:** Built a responsive dark-themed portfolio with HTML, CSS variables, and JavaScript in a single index.html file
- **Problem Solving:** Refactored the project from a cluttered 9-file structure into a clean, deployment-ready 3-item folder
- **Documentation:** Maintained detailed step-by-step project documentation with screenshots at every stage of development and deployment.
